

Flight Descriptions Read Me.txt

Flight Descriptions are furnished in the form of copies of the FS9 Navigation Logs and the FSN Flight Plans. Please note that the FS9 Navigation Logs for a GPS flight are very sparse and do not show the flight altitude. It is recommended that you look at the FSN Flight Plan to obtain the altitude. In general, C-47 flights are at 7500 ft and C-54 flights are at 10,500 ft.

Note that some of the FS9 Navigation Logs have a fuel quantity very close to the estimated fuel required for the flight. The fuel on your actual flights should be increased to give yourself enough fuel to make your alternate airport, if possible. Note also that on some of the longer DC-3 flights, there is so much fuel required that the payload is severely limited. You may want to use the C-54 on these flights.
