

## **Installing the Start-up Files in P3Dv5**

Select all .fxml and .wx files and copy them into C:\Users\Owner\Documents\Prepar3D v5 Files

Start P3D

In the Scenario Window hit load, select the right flight and hit OK and OK again.

If your P3D skips the Scenario Window then Hit Scenario on the top menu bar and choose Load.

The Start-Up file places you cold and dark on the right location and runway. Due to different simulators the runway heading may differ one degree.

The correct weather is installed, but you need to choose date and time yourself from the flight description and you may want to use a different DC3/C-47.

If you want the flight plan on the P3D map you can use the included .pln file to be loaded in Navigation->Flight Planner.
