

Set up flights in P3Dv5

Select all Flight Files (.FXML files) and Weather Files (.WX files) and copy them into C:\Users\Owner\Documents\Prepar3D v5 Files.

Select all Flight Plan files (.PLN) and copy them to any folder that you can easily access.

Start P3D

- In the Scenario Window hit load, select the right flight and hit OK and OK again.
If your P3D skips the Scenario Window then hit Scenario on the top menu bar and select Load.
- The Start-Up file places you cold and dark on the right location and runway. Due to different simulators the runway heading may differ one degree.
- The correct weather is installed, but you need to select Date and Time yourself (see flight description)
- You may want to use a different DC3/C-47.
- If you want the flight plan on the P3D Map you can use the included Flight Plan (.PLN file) to be loaded in Navigation->Flight Planner.
